

Planning with the Center-of-Mass rather than Stances for Humanoids walking on Uneven Terrains

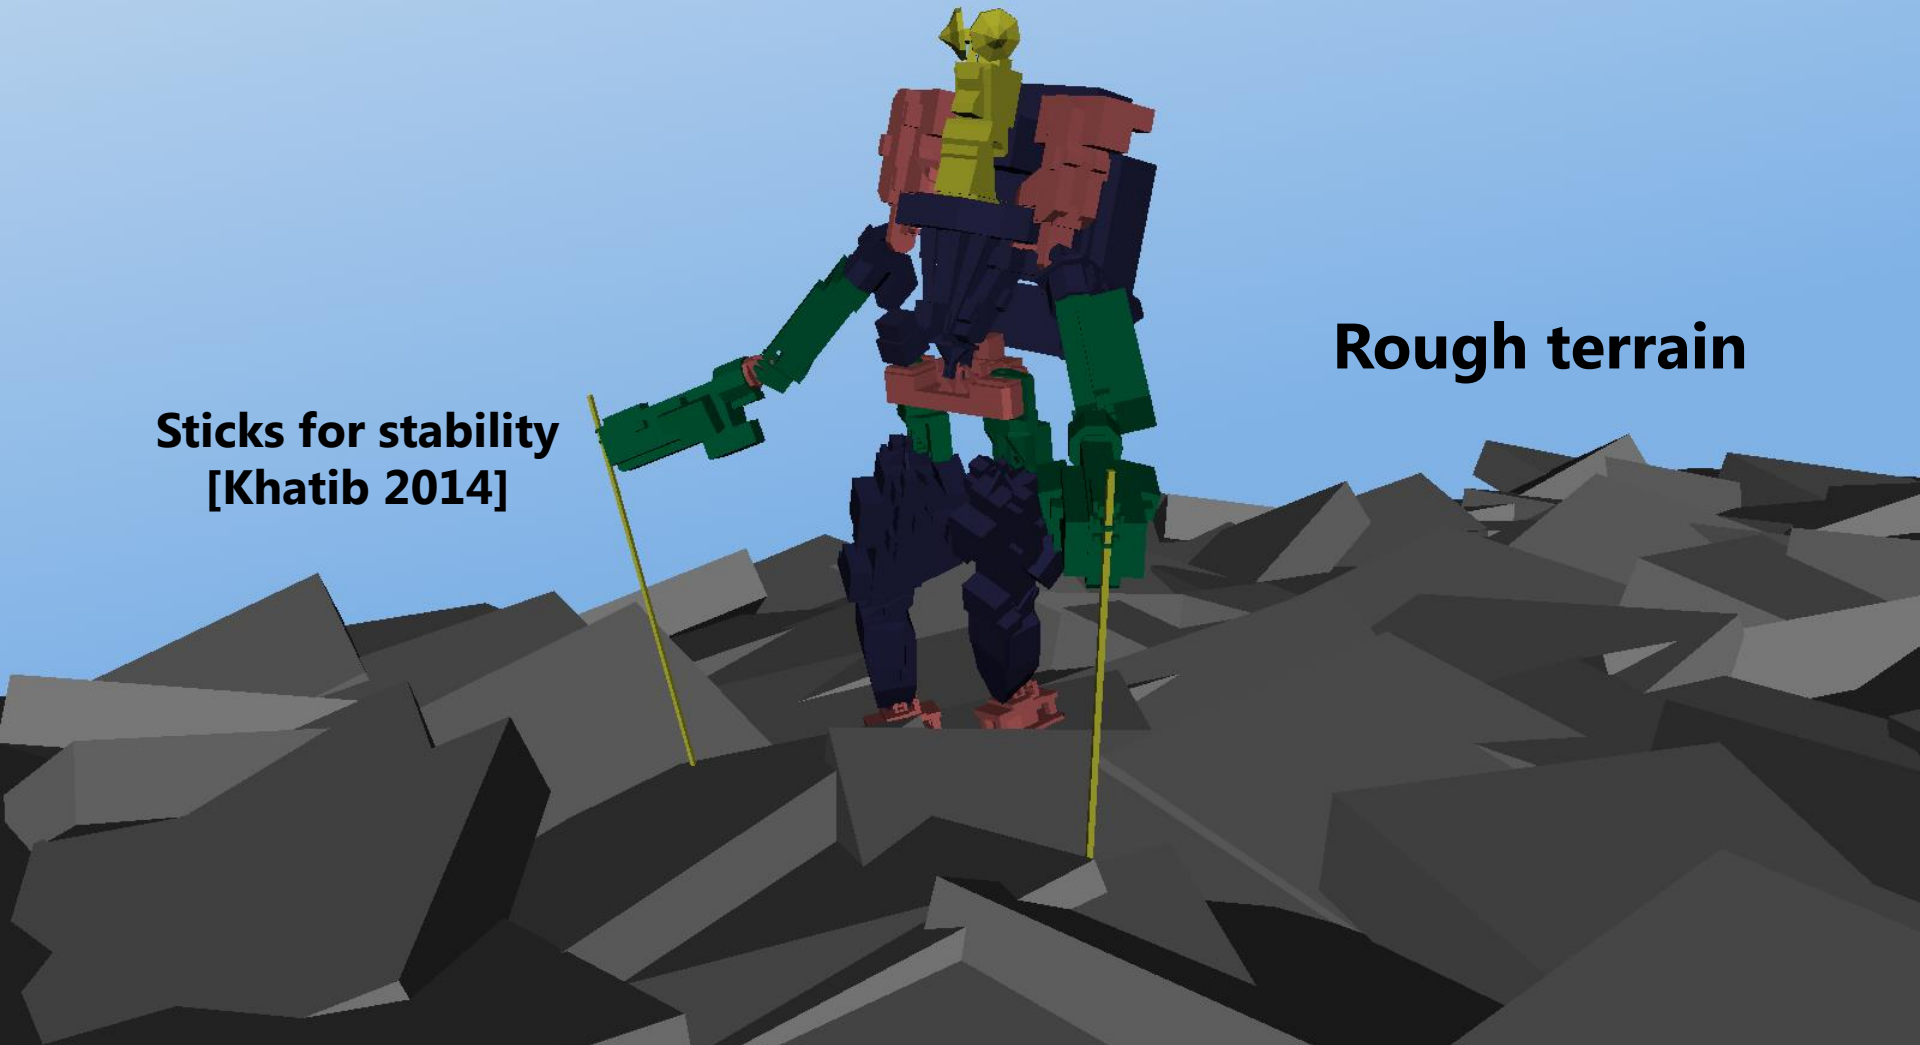

Stéphane Caron and Yoshihiko Nakamura

Nakamura-Takano Laboratory, The University of Tokyo, Japan

Setting

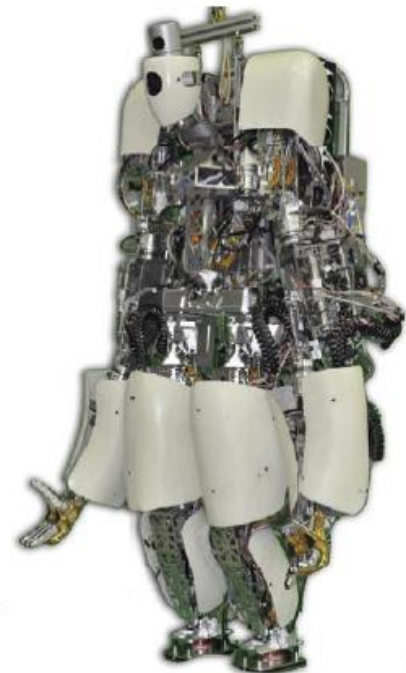

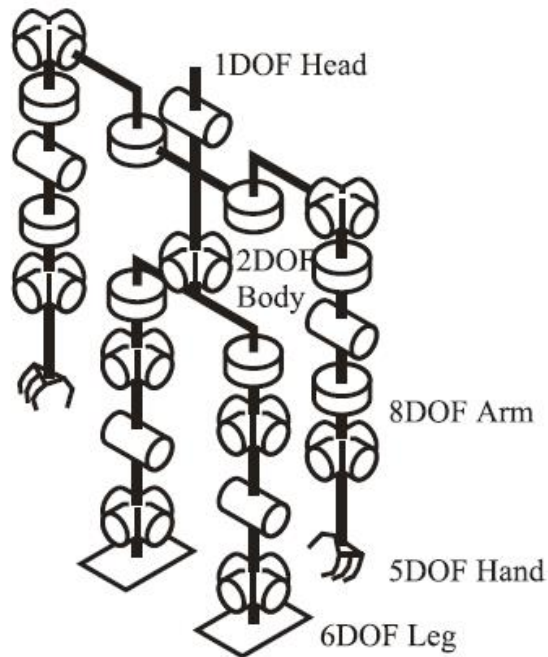

Sticks for stability
[Khatib 2014]

Rough terrain

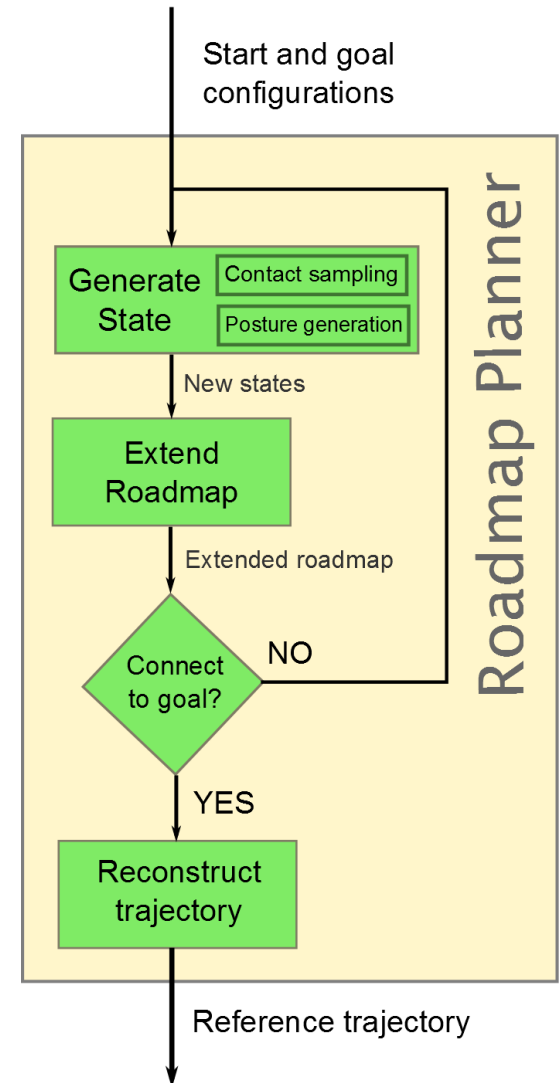

Hydra

- 41-DOF humanoid robot developed at Nakamura-Takano Laboratory
- All joints actuated by Electro-Hydraulic Actuation (EHA) [[Kaminaga 2010](#)]

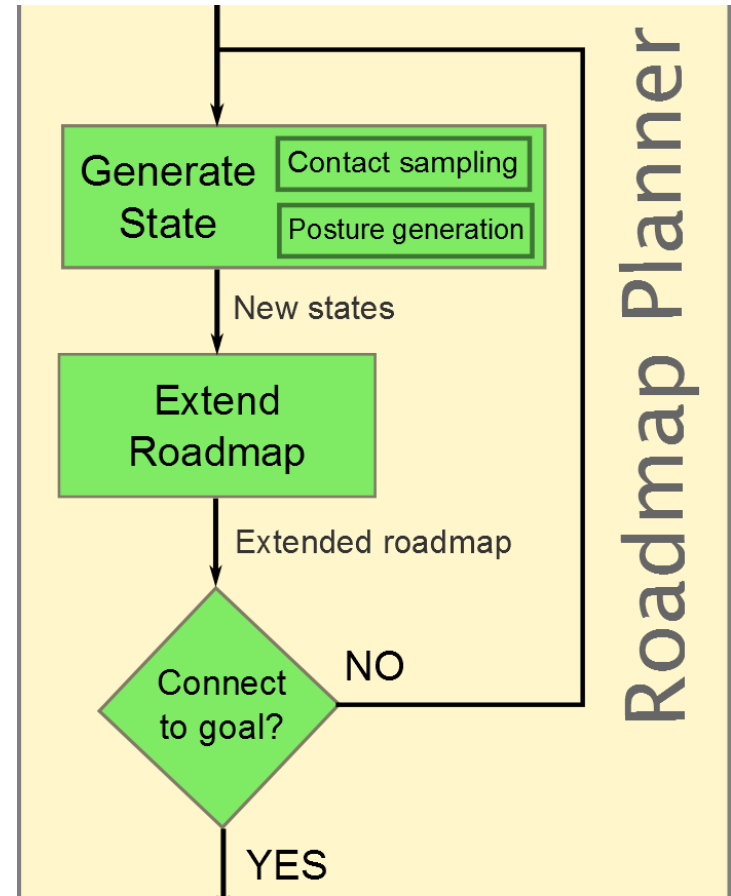

Problem

- **Motion Planning:**
generate a reference trajectory
connecting start and goal
configurations
- **State-of-the-art:**
contact planner with a posture
generation step
- **Bottleneck:**
posture generation (PG) is slow
- **Contribution:**
reduce calls to PG by considering the
desired direction of motion

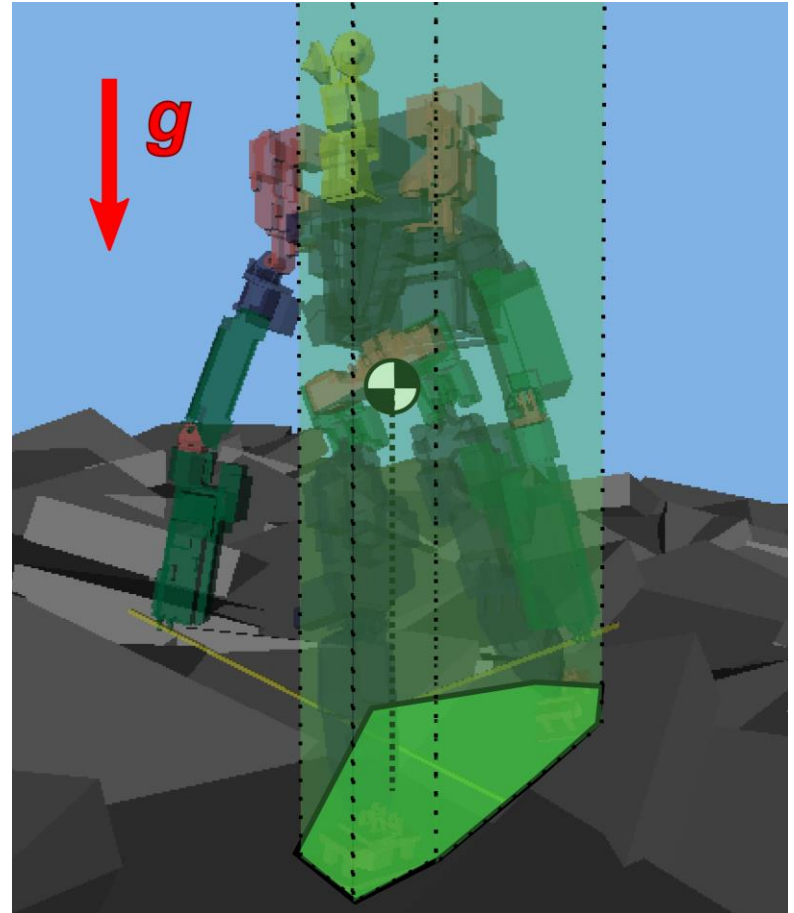

Posture Generation

- **Contribution:**
reduce calls to PG by considering the desired direction of motion
- We focus on the *posture generation* loop of the roadmap planner

Static Stability

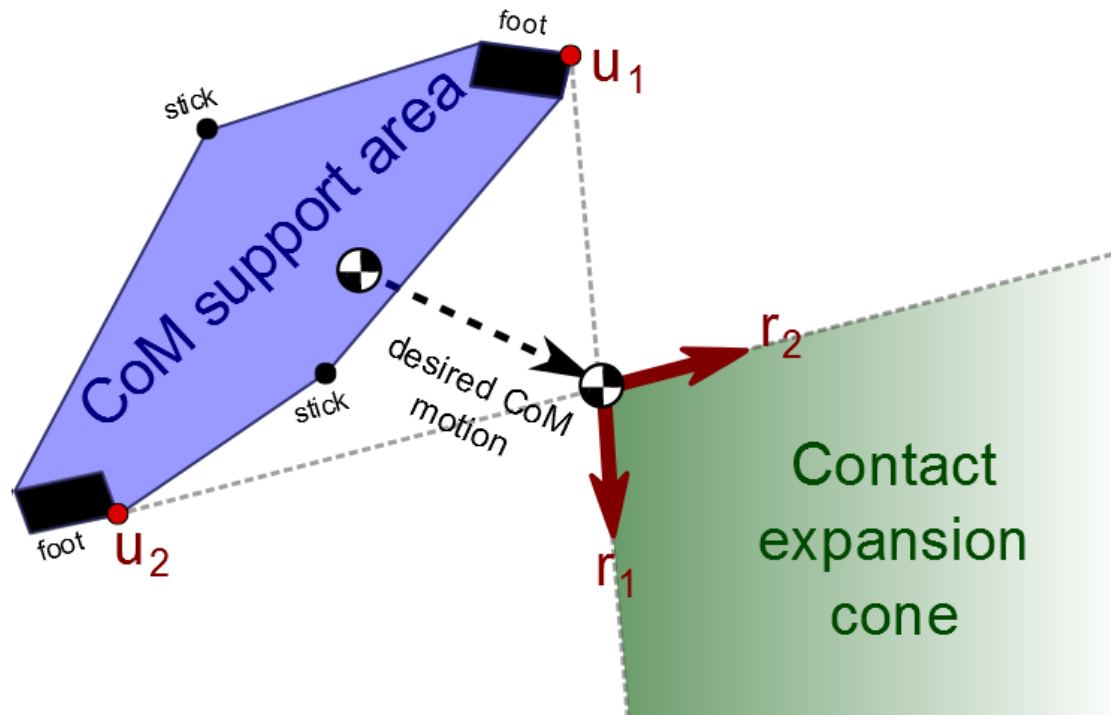

- **Static stability condition:**
the CoM lies in a right cylinder parallel to gravity [[Bretl 2008](#)]
- **Computing this cylinder:**
 - Recursive Polytope Projection [[Bretl 2008](#)]
 - Double description method [[this paper](#)]

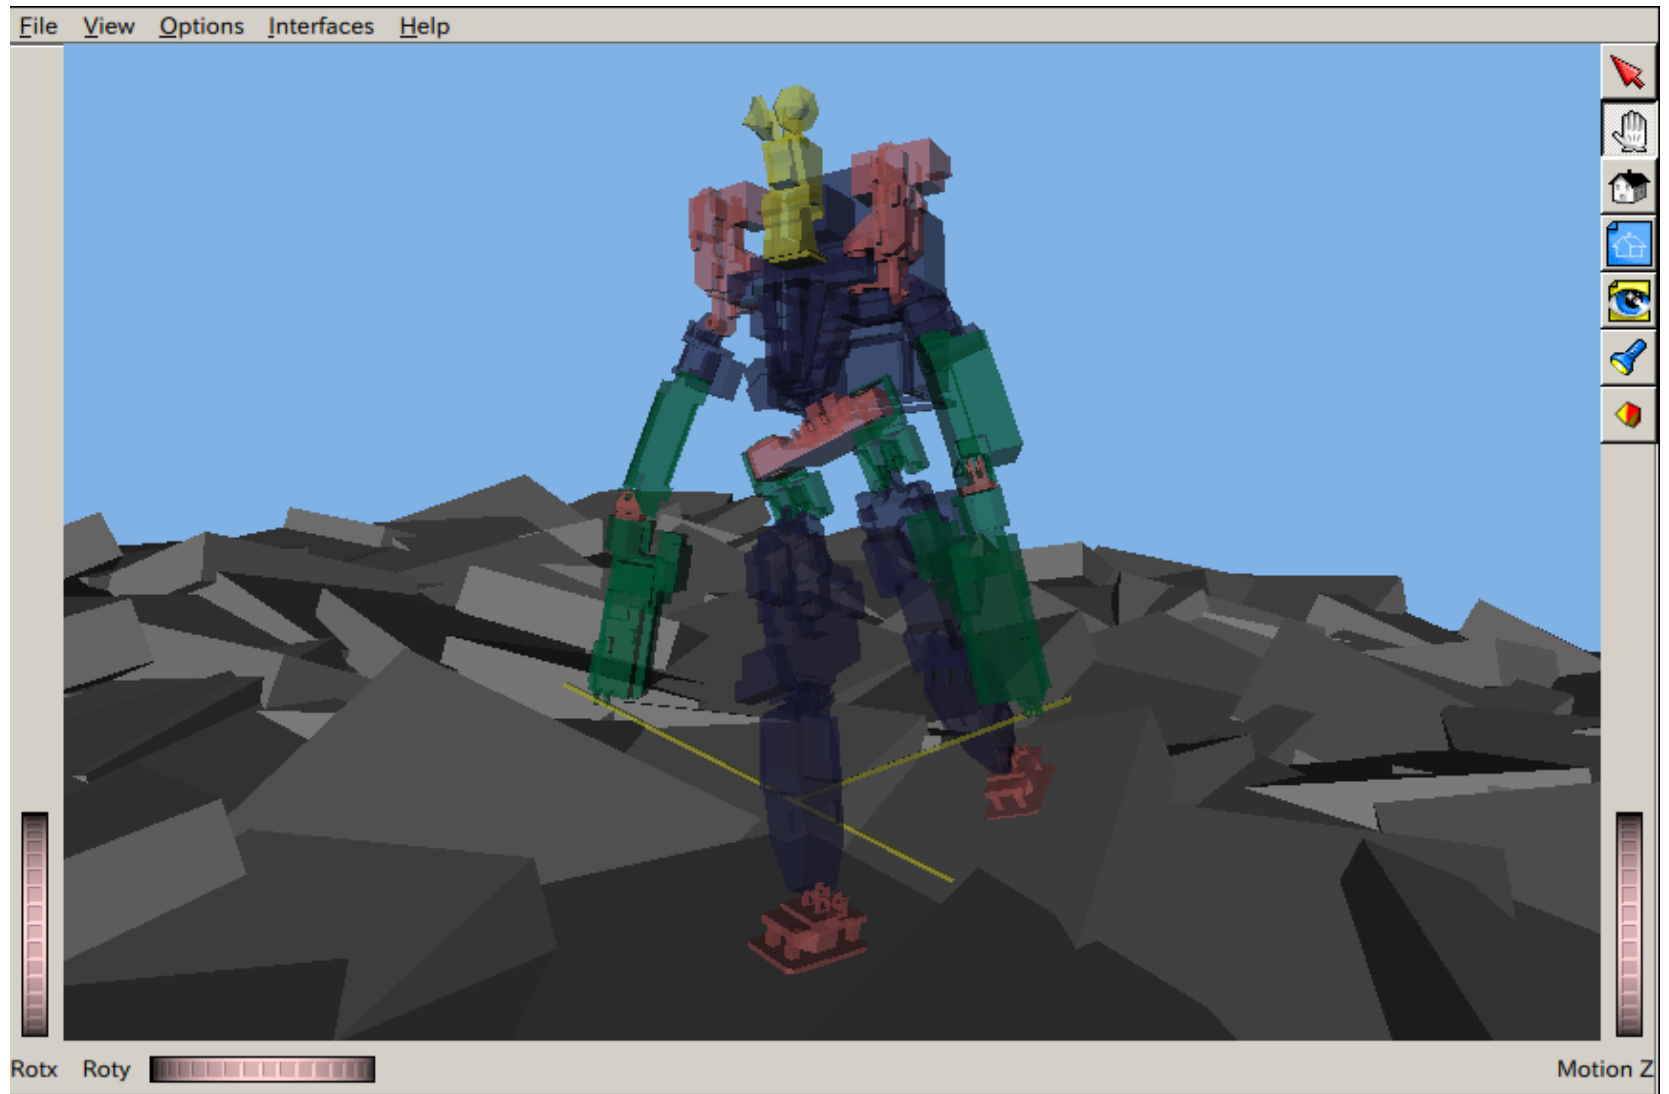

CoM-based steering

When moving a contact (foot or stick):

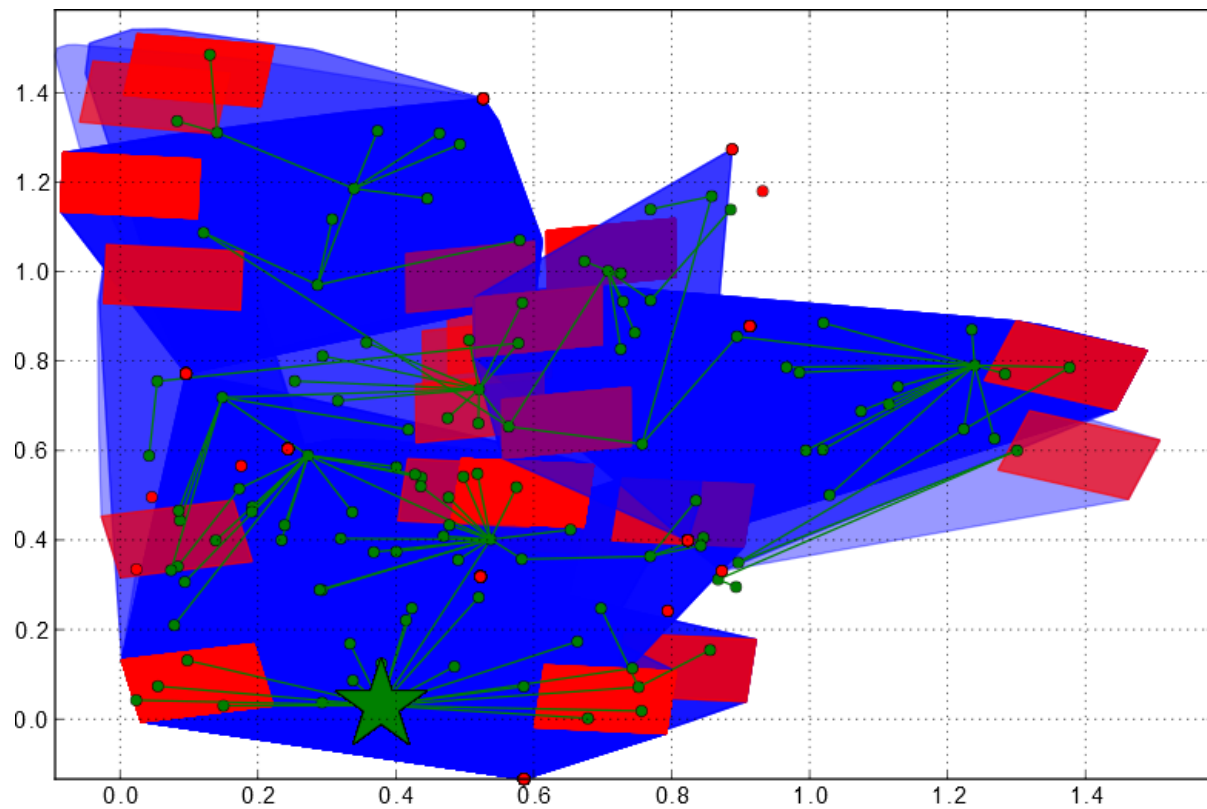

- **Previous:** sample next contact positions at random
- **This work:** select contact position based on desired CoM

Generated Postures (samples)

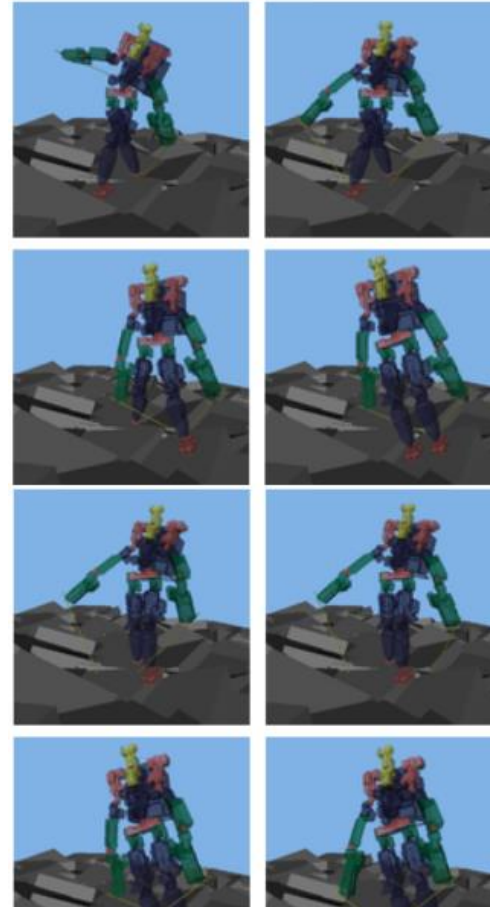

Roadmap with Stability Polygons

Conclusion

- **Roadmap planners** for humanoids usually require many calls to the posture generator; we filter these calls by considering **desired CoM motions**
- **Contribution** to motion planning: plan in reduced CoM state space, link with contact
- Validation: posture generation for Hydra on rough terrain

Thank you for your attention.
